

SSC ingredients along the line of sight : equal physical $k = (\ell + 1/2)/\chi_{\text{CoCoA}}(z)$

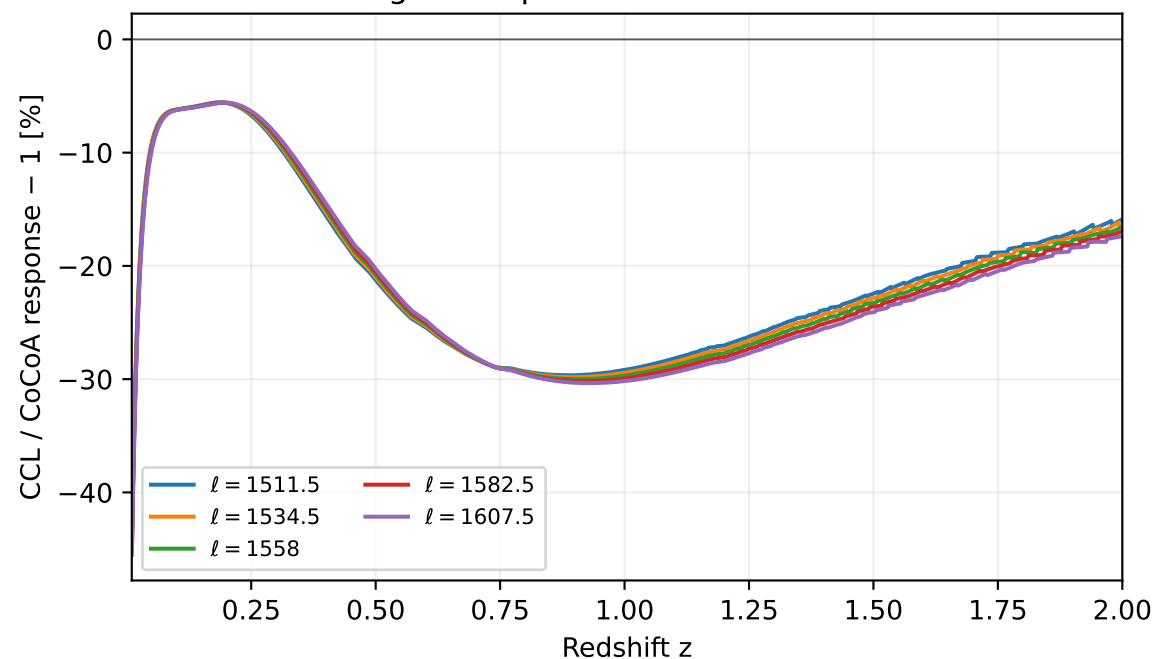

Displayed range: $z = 0.01$ -2; all original nodes/signs are retained in the archive.

Near-zero denominator masks: 0. Dotted: CCL k extrapolation. Ingredient ratios are not covariance errors.

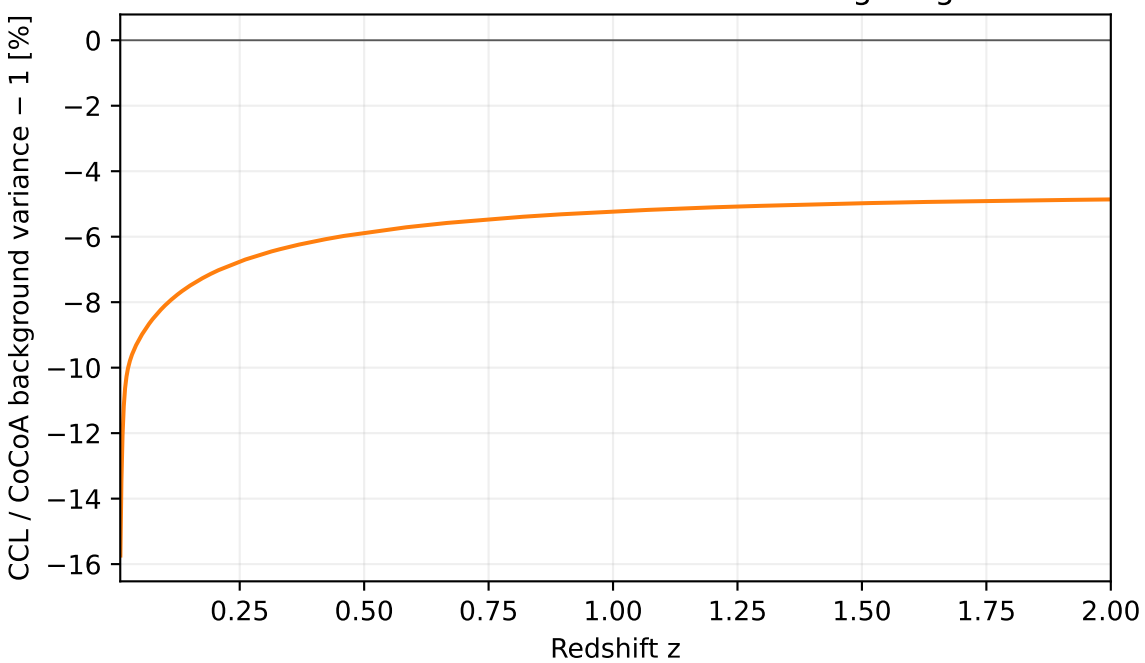

Low multipoles: same k at each z

High multipoles: same k at each z

Window difference before radial weighting

Where the native CoCoA SSC signal accumulates
